

LESSON
7-3

Converting within Measurement Systems

Reteach

You can use a bar model to convert measurements.

$\frac{1}{12} = \frac{3}{36}$ so 3 feet = 36 inches

$\frac{1,000}{1} = \frac{4,000}{4}$ so 4,000 g = 4 kg

1. Draw a bar model for converting feet to yards.

2. Draw a bar model for converting cups to fluid ounces.

3. Do you think a bar model would be a good model for converting miles to feet? Explain.
